ficiency on the organism, it may be assumed that the alterations observed in the experimental animals are fundamentally associated with the development of acute folic acid deficiency. One of its first clinical manifestations in dogs is a disturbance of intestinal function. Peculiar alterations in the structure of the intestinal epithelium are noted. The morphological picture observed of the intestinal epithelium involved resembles that described after X-irradiation. The marked leukopenia, also characteristic of disturbances caused by X-irradiation, strengthens the resemblance. (Author)
